

Scenario 4

$$N_{K=2} = 15\% (30)$$

Scenario 5

$$N_{K=2} = 8.5\% \quad (17)$$

Scenario 6

$$N_{K=3} = 53.5\% (107)$$

Scenario 7

$$N_{K=3} = 60.5\% (121)$$

Scenario 8

$$N_{K=4} = 9\% (18)$$

Scenario 9

$$N_{K=3} = 27.5\% \text{ (55)}$$

Box plot showing the distribution of the Frailty Death process (v) for two Mass categories (1 and 2). The y-axis ranges from -1.5 to 1.5. The x-axis is labeled Mass (k). The plot shows that the Frailty Death process is significantly higher for Mass 2 compared to Mass 1. Horizontal dashed lines indicate the mean values for each group: approximately 1.0 for Mass 2 (green) and -1.2 for Mass 1 (blue).

Box plot showing the Frailty Death process (v) for two Mass categories (1 and 2). The y-axis ranges from -2.0 to 1.0. The x-axis is labeled 'Mass (k)'. The plot shows that the Frailty Death process is significantly higher for Mass category 2 compared to Mass category 1. Horizontal dashed lines are present at $v \approx 0.4$ (green) and $v \approx -1.1$ (blue).

A box plot showing the distribution of the Frailty Death process (v) for three groups defined by Mass (k): 1, 2, and 3. The y-axis ranges from -6 to 4. Three horizontal dashed lines are present: blue at v ≈ -1.2, green at v ≈ 0.3, and orange at v ≈ 1.1. Group 1 (blue box) has a median around -2.8, with whiskers from -3.8 to -1.8 and outliers at -5.5 and -7.0. Group 2 (green box) has a median around 0.2, with whiskers from -1.2 to 1.2. Group 3 (orange box) has a median around 1.8, with whiskers from 1.2 to 2.8, and outliers at 3.2 and 3.5. A label '8' is placed above the orange box.

A box plot showing the distribution of the Frailty Death process (v) for three groups defined by Mass (k). The y-axis ranges from -4 to 3, and the x-axis has categories 1, 2, and 3. Group 1 (blue) has a median around -2.5. Group 2 (green) has a median around 0. Group 3 (red) has a median around 2.0. Horizontal dashed lines are present at v = 0.7 (orange), v = 0.5 (green), and v = -1.2 (blue).

Mass (k)	Median (v)	Q1 (v)	Q3 (v)	Min (v)	Max (v)	Outliers (v)
1	-2.5	-2.8	-2.2	-3.5	-1.5	-4.2, -4.0, -3.8
2	0.0	-0.2	0.3	-0.8	0.8	-0.5, 0.5
3	2.0	1.8	2.2	1.5	2.8	3.0, 3.2

Box plot showing the distribution of the Frailty Death process (v) for different Mass (k) values (1, 2, 3, 4). The y-axis represents the Frailty Death process (v), ranging from -4 to 2. The x-axis represents Mass (k), ranging from 1 to 4. The plot includes horizontal dashed lines at $v = 2$ (pink) and $v = -2$ (green). The box plots show a clear upward trend in the median and overall distribution as Mass increases.

Box plot showing the Frailty Death process (v) for three Mass (k) categories (1, 2, 3). The y-axis ranges from -2 to 4. A dashed orange line is at v=0. Category 1 (blue) has a median around -1.8. Category 2 (black) has a median around 0.2. Category 3 (orange) has a median around 2.4. Outliers are present for all categories.

Figure 1: A plot of weights (w) versus mass (k). The y-axis ranges from 0.0 to 1.0, and the x-axis ranges from 0 to 3. Two data points are shown: one at $k=1$ with a weight of approximately 0.5, and another at $k=2$ with a weight of approximately 0.45. Both points have vertical error bars. A horizontal dashed green line is drawn at $w \approx 0.48$.

Box plot showing the distribution of weights (w) for two mass categories (k).

- The y-axis represents weights (w), ranging from 0.0 to 1.0.
- The x-axis represents Mass (k), with categories 1 and 2.
- For Mass (k) = 1, the weights are distributed between approximately 0.22 and 0.42, with a median around 0.30. A blue dashed line is drawn at $w \approx 0.28$.
- For Mass (k) = 2, the weights are distributed between approximately 0.55 and 0.78, with a median around 0.65. A green dashed line is drawn at $w \approx 0.68$.

Box plot showing the distribution of Weights (w) for different Mass (k) values (1, 2, 3). The y-axis represents Weights (w) from 0.0 to 1.0. The x-axis represents Mass (k). Horizontal dashed lines indicate reference weights: red at 0.3, blue at 0.4, and green at 0.25. The box plots show the median (black line), interquartile range (colored box), and range (whiskers). Outliers are shown as small circles.

Mass (k)	Median (w)	Q1 (w)	Q3 (w)	Min (w)	Max (w)	Outliers (w)
1	~0.28	~0.22	~0.38	~0.08	~0.48	None
2	~0.28	~0.25	~0.32	~0.15	~0.45	~0.08, ~0.48
3	~0.42	~0.32	~0.48	~0.10	~0.60	None

A box plot showing the distribution of weights (w) for four different models, labeled 1, 2, 3, and 4 on the x-axis. The y-axis represents the weights (w) ranging from 0.0 to 1.0. A horizontal dashed red line is drawn at $w \approx 0.24$. Model 1 (dark blue) has a median around 0.22. Model 2 (green) has a median around 0.08. Model 3 (orange) has a median around 0.15. Model 4 (magenta) has a median around 0.55. Outliers are present for all models, with Model 4 having several outliers above 0.6.
